## PROFILE

Full stack developer who builds complete applications, from the database to production, in React, Next.js, TypeScript, Node.js, PHP and Go. At Startech Team I started with internal tools and automation, then took over development of the sigurantapenet.ro platform, and since October 2026 I have been developing the OptimumDesk platform, including its XDR module, with 201 pull requests merged into production in five weeks. I use Claude Code (AI-assisted coding) every day for research and implementation; the architectural decisions and the review stay mine, and I do not commit code I cannot explain.

## TECHNICAL SKILLS

**Front end:** React 19, Next.js 15 and 16 (App Router, server rendering), TypeScript, JavaScript (ES6+), Vite, Tailwind, Blade, Bootstrap (existing codebase), HTML, CSS, responsive design

**Back end:** Node.js (Fastify), PHP 8 (Laravel, Symfony), Go, REST APIs, queues and scheduled jobs, authentication and secure applications

**Databases:** MySQL, PostgreSQL, Oracle 19c, SQLite, Supabase, Prisma, Drizzle; schemas, migrations, indexes and constraints, SQL portable between MySQL and Oracle

**API integration:** REST and JSON-RPC, webhooks, retries on failure and rate limits, Stripe, third-party vendor APIs

**Cloud, CI/CD and DevOps:** Docker, GitHub Actions CI/CD, Vercel, Supabase, Hetzner, Cloudflare, Linux servers, scheduled jobs (cron), automated backups, Git with pull requests and conventional commits

**Automation:** PowerShell, Bash, scheduled tasks, browser extensions, loading data from PDF and Excel into databases (ETL)

**AI in development:** Claude Code, with project rules, my own skills and hooks, and a git worktree per pull request; research and brainstorming before code

**Testing:** PHPUnit, Pest, Vitest, Playwright, Go tests, test-driven development (TDD)

## PROFESSIONAL EXPERIENCE

**Software Developer, OptimumDesk platform, Startech Team** *· October 2026 to present*

- Built the platform's XDR module (attack detection on customers' computers) two ways: an integration with Wazuh over its API, which receives the events collected by the agent and brings the alerts back into the portal, and a detection engine of the platform's own, which runs the same rules without Wazuh, with an identical result on all 307 test cases.
- 201 pull requests merged into production in the first five weeks, on the platform portal (PHP, React, TypeScript) and on the agent API (PHP, Go), each with its tests written before the code.
- Integrations with third-party vendor APIs (Bitdefender GravityZone, Check Point, FortiGate): scheduled data sync, events received by webhook, and retries when a call fails.
- Go components for the agent that collects events from customers' computers, on Windows and Linux, taken to production after testing on my own virtual machines.
- Screens and dashboards in React and TypeScript. Every new query runs on both MySQL and Oracle, for the customers who install the platform on their own servers.

**IT Engineer, automation and internal tools, Class IT Outsourcing (Startech Team)** *· June 2024 to September 2026*

- From March 2026, took over development of sigurantapenet.ro, a training platform in production that others had built in Laravel over three years: 262 commits across the back end and front end, with the application running the whole time.
- Modernised the sigurantapenet.ro interface page by page, moving 37 pages to Tailwind with no regressions in the rest of the application, and rebuilt the homepage, sign-in and learning area, plus an interactive JavaScript simulator about fake content generated with AI.

- A free account can no longer move itself onto a paid plan, and every user's password is now stored in a modern format, migrated with no forced resets and no downtime.
- A JavaScript browser extension that cut a six-step routine to a single click; adopted by the whole team and used on every monitoring ticket.
- Prototype internal application in Next.js and TypeScript (Prisma, PostgreSQL, Docker) for the team's operational documentation, with import from the existing Excel files and automated tests.
- PowerShell and Bash automation that took recurring tickets off the queue: notifications before a password expires, alerts for updates, scheduled backups on Linux servers with retention and an alert when one fails.

Earlier: IT support at BSlash (2023 to 2024) and service desk at SCC Services Romania (2021 to 2022).

## PROJECTS

**avariiacum.ro: utility outage reporting (own product, live)** *Next.js 16 · React 19 · TypeScript · Supabase · Vercel*

- Public application, live in Bacau, Iasi and Galati, where residents report anonymously that the water, power or heating is off; when several people in the same neighbourhood report within the same hour, the page announces a likely outage.
- Launched in two days, with fast server-rendered pages; it needs no account and keeps no personal data long term.

**school-logistics: SaaS platform for driving schools (own product, ready to launch)** *Laravel · PHP 8.4 · React · TypeScript · Inertia.js · MySQL · Stripe*

- Built alone in three and a half months: accounts for the owner, office staff, instructors and students, online learning with the official exam questions, and subscription billing.
- Over 1,200 tests and one pull request per task; one school's data never mixes with another's.

**FINFORGE: household budgeting app, in daily use** *React 19 · TypeScript · Node.js · Fastify · SQLite · Docker*

- Multi-currency budget, savings goals and real-time sync between phones, with reminder notifications.
- Hosted on my own server in a Docker container, deployed from GitHub Actions, with around 400 tests.

**ScoliDeSofer.ro: public directory of more than 3,000 driving schools** *Astro · TypeScript · Vercel*

- The data comes from official reports published every year in PDF and Excel, in a different format each year; the ranking stays fair for schools with few candidates too.

**Apollo Booking: online appointment platform (own product, in production)** *PHP · Laravel · Filament · PostgreSQL · Docker*

- Taken from nothing to production: admin panel, booking from a phone, email and SMS confirmations. The system never accepts two bookings for the same slot, even when the requests arrive in the same second.

## EDUCATION

B.Eng. Information Technology Engineering, Vasile Alecsandri University of Bacau, 2019 to 2023. Thesis: a ticketing and administration system for student accommodation (Laravel 9, MySQL, Blade).

## CERTIFICATIONS AND LANGUAGES

JavaScript Development (including a React project), Software Development Academy, 2023

Languages: Romanian (native), English (professional)
